In the Claims:

- (Currently Amended) A method of maintaining one or more 1. wet-tantalum capacitors in an implantable medical device, with each capacitor having a rated voltage or a maximum-energy voltage, the method comprising:
 - maintaining at least one of the wet-tantalum a) capacitors at a high voltage relative its rated voltage or maximum energy voltage for a time; and
 - discharging, after the time, the at least one of the b) wet-tantalum capacitors through a non-therapeutic load, wherein discharging includes allowing the charge on at least one capacitor to dissipate through leakage current.
- The method of claim 1, wherein discharging (Original) further includes discharging the at least one capacitor through the lead system at rates below a therapeutic level.
- The method of claim 1, wherein discharging 3. (Original) further includes discharging the at least one capacitor through the lead system at levels that are non-therapeutic.
- The method of claim 2, wherein discharging (Original) further includes discharging the at least one capacitor through a resistor.
- The method of claim 4, wherein the 5. (Original) resistor includes a resistance value of 1000 ohms.

- 3 -

37505.0387

- The method of claim 1, wherein discharging (Original) further includes allowing the charge on at least one capacitor to dissipate through system leakage.
- The method of claim 1, wherein the at (Original) 7. least one capacitor is allowed to float for a time before discharging the at least one capacitor.
- The method of claim 7, wherein the time is 8. (Original) about sixty seconds.
- The method of claim 1, wherein the high (Original) 9. voltage is about ninety percent of a rated voltage or a maximum-energy voltage of the at least one capacitor.
- The method of claim 1, wherein discharging 10. (Original) includes discharging until a voltage level is reached.
- The method of claim 10, wherein the 11. (Original) voltage level is ten volts less than the maximum-energy voltage.
- The method of claim 11, wherein the (Original) voltage level is the maximum-energy voltage minus ten volts per wet-tantalum capacitor in the system.
- The method of claim 1, wherein discharging (Original) 13. includes discharging for a predetermined period of time.
- The method of claim 1, wherein the (Original) discharging is internal to the implantable device.

- 4 -

37505.0387

- The method of claim 1, wherein maintaining (Original) 15. at least one of the wet-tantalum capacitors at a high voltage for a time includes maintaining at a high voltage for about 5 minutes.
- The method of claim 1, wherein maintaining 16. (Original) at least one of the wet-tantalum capacitors at a high voltage for a time includes maintaining at a high voltage for a range of time between about fifteen seconds to ten minutes.
- The method of claim 1, wherein the (Original) 17. implantable device includes an implantable cardioverter defibrillator.
- The method of claim 1, wherein the 18. (Original) implantable device includes a pacemaker.
- The method of claim 1, wherein the method (Original) 19. further includes aborting the discharging through the nontherapeutic load if the implantable device detects a condition requiring device therapy.

37505.0387

- 20. (Currently Amended) An apparatus comprising:
 - a) a lead system suitable for sensing electrical signals of a heart and for delivering electrical therapy to a heart;
 - b) a therapy system coupled to the lead system, wherein the therapy system includes a capacitor system to store electrical energy to be delivered in measured doses through lead system, the capacitor system including at least one wet-tantalum capacitor;
 - a monitoring system coupled to the lead and therapy systems, wherein the monitoring system maintains the at least one capacitor at a high voltage and periodically discharges the at least one capacitor through leakage current; and
 - <u>d)</u> an implantable housing containing the therapy, capacitor, and monitor systems.
- 21. (Original) The apparatus of claim 20, wherein the apparatus is an implantable cardioverter defibrillator.
- 22. (Original) The apparatus of claim 21, wherein the high voltage is ninety percent of a rated maximum voltage of the at least one wet-tantalum capacitor.
- 23. (Original) The apparatus of claim 22, wherein the monitor system discharges the at least one capacitor until a predetermined voltage level is reached.
- 24. (Original) The apparatus of claim 22, wherein the monitor system discharges the capacitor for a predetermined period of time.
